

TMF Workshop: Anonymization tools and their practical relevance (for biomedical research)

ARX

A Comprehensive Tool for Anonymizing Biomedical Data

Fabian Prasser, Florian Kohlmayer, Klaus A. Kuhn

Lehrstuhl für Medizinische Informatik
Institut für Medizinische Statistik und Epidemiologie
Klinikum rechts der Isar der TU München

ARX: Towards useful data anonymization

- **Usability has many dimensions**
 - Ability to balance data utility with privacy requirements
- **Need to support a broad spectrum of methods**
 - Privacy models
 - Transformation models
 - Methods for analyzing data utility
 - Methods for analyzing risks
- **Further “non-functional” requirements**
 - Integrated and harmonized: ARX is not a “tool box”
 - Compatibility (syntactic and semantic)
 - Performance and scalability
 - Intuitive visualization and parameterization
 - Provide methods to end-users as well as programmers

ARX: Highlights

- **Compatibility**
 - **Built-in data import facilities**
 - Relational databases (MS SQL, DB2, SQLite, MySQL)
 - MS Excel
 - CSV (all common formats, auto-detection)
 - **Support for different data types and scales of measure**
 - Strings (with nominal and ordinal scale)
 - Dates (interval scale)
 - Numbers (ratio scale)
 - Automatic detection of data types and formats
 - **Methods for handling and cleaning low-quality data**
 - Handles missing and invalid values correctly
 - In privacy models, transformation methods, visualizations
 - Manual removal of tuples, query interface, find & replace

ARX: Highlights

- **Flexible transformation methods**
 - **Global recoding**
 - Full-domain generalization
 - Top- & bottom coding
 - **Local recoding**
 - Tuple suppression
 - **Fully integrated and parameterizable**
 - Importance of attributes, suitability of methods
- **Functional representations of transformation rules**
 - Especially functional representations of hierarchies
 - Support for categorical and continuous variables (categorization)
- **Multiple methods for measuring data utility**
 - Parametrizable, e.g., with different aggregate functions
 - Use functional representations of transformation rules

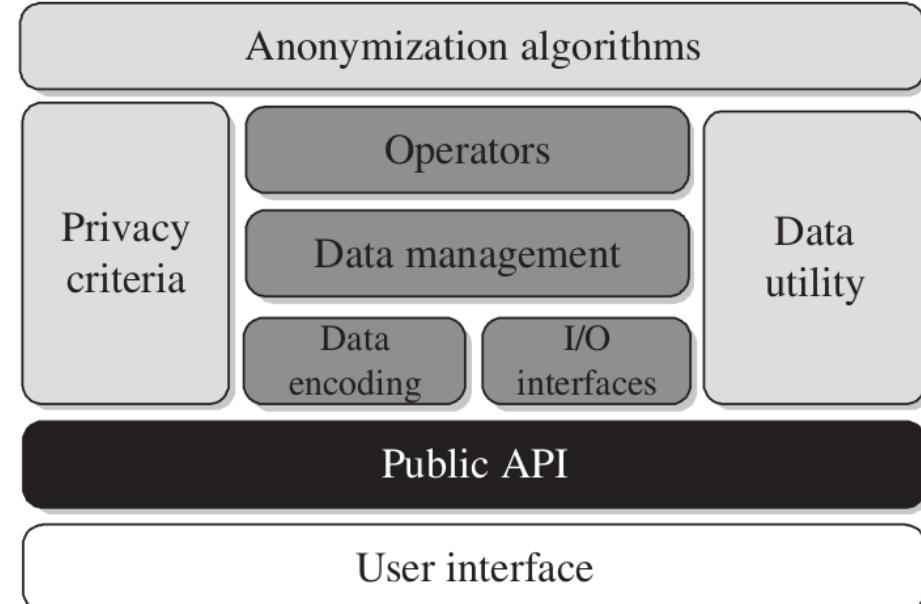

ARX: Highlights

- **Multiple apriori privacy models**
 - k-Anonymity
 - ℓ -Diversity (distinct, entropy, recursive-(c, ℓ))
 - t-Closeness (equal and hierarchical ground distance)
 - δ -Presence
- **Multiple methods for risk-based anonymization**
 - Sample characteristics
 - Average cell size
 - Sample uniqueness
 - Super-population models
 - Decision rule by Dankar et al.
 - Based on models by Pitman, Zayatz and the SNB model
- **Support for arbitrary combinations of these models**
 - Optimal solution within our coding model

ARX: Highlights

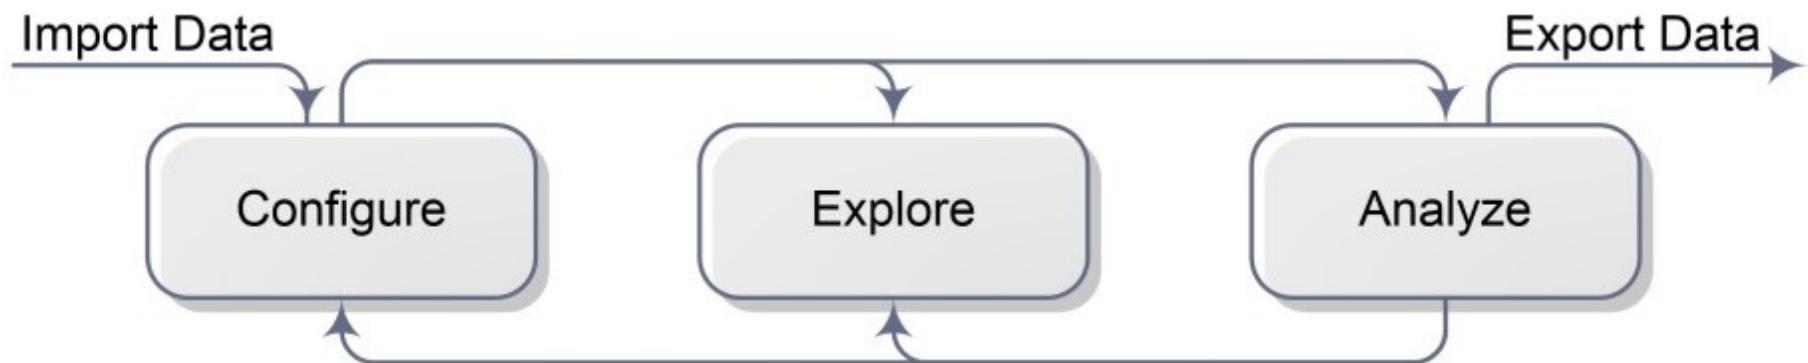

- **Scalability:** ARX can handle large datasets (several million data entries) on commodity hardware
- **Efficient in-memory data management engine**
 - Works with compressed data representations
 - Tight coupling between transformation operators and the „database kernel”
 - Provides a space-time trade-off
- **Optimized search strategy:** Based on multiple pruning strategies
- **Efficient implementations of further complex tasks**
 - Evaluations of privacy criteria (e.g. t -closeness, δ -presence)
 - Methods for solving non-linear equation systems
 - Background jobs in the user interface

ARX: Highlights

- **Comprehensive graphical interface**
 - Scalability comparable to the ARX API
 - Supports all methods provided by the ARX API
 - Cross-platform (Windows, Linux/GTK, OSX) with native interfaces
 - Available as binary distributions with installers
 - **Independent API**
 - User interface sits on top of the API
 - Java library
 - All methods provided by ARX are first-class citizens in both worlds
- 

ARX: Anonymization workflow

- Iterative process to successively refine transformations
- Supported by the scalability of our framework
- Three (repeating) steps, mapped to four perspectives

- Define transformation model
- Define privacy model
- Define coding model

- Filter and analyze the solution space
- Organize transformations

- Compare and analyze input and output
- Regarding risks and utility

ARX: Wizard for data import

The image displays four windows of the ARX Import data wizard:

- CSV:** Shows settings for importing a CSV file (adult.csv) with a delimiter of ; and quote of ". It includes a preview of the data and a checkbox for "First row contains column names".
- JDBC:** Shows settings for importing from a MySQL database on localhost port 3306, using root credentials and the anonymize database.
- Excel:** Shows settings for importing an Excel file (test.xls) with the first sheet selected. It includes a preview of the data and a checkbox for "First row contains column names".
- Columns:** Shows a list of detected columns with their current datatypes and formats. The "age" column is highlighted with a dropdown menu showing options: Integer 100%, Decimal (#,##0) 100%, Decimal (#,##0,##) 100%, and String 100%.

ARX: Configuration (1)

The screenshot shows the ARX Anonymization Tool interface. The main window title is "ARX Anonymization Tool - Example". The menu bar includes File, Edit, View, Help. The toolbar contains icons for opening files, saving, transforming, and analyzing. The status bar at the top right displays "Transformations: 12960 Selected: [0, 2, 0, 1, 2, 1, 1, 1, 0] Applied: [0, 2, 0, 1, 2, 1, 1, 1, 0]". Below the toolbar is a navigation bar with tabs: "Configure transformation" (selected), "Explore results", "Analyze utility", and "Analyze risk".

The main workspace is divided into two main sections:

- Input data:** A table view showing a subset of the dataset. The columns are labeled sex, age, race, marital-status, education, and workclass. Rows 1 through 26 are listed, all showing "Female" in the sex column. The "age" column ranges from 51 to 60. The "race" column has values Black, White. The "marital-status" column has values Divorced, Never-married, Separated, Widowed. The "education" column has values Some-college, Bachelors, Masters. The "workclass" column has values Unemployed, Private, Self-employed, Private, Private.
- Configuration Panel:** This panel is titled "Configure transformation" and is currently selected. It includes:
 - A header row with dropdowns for Type (Quasi-Identifying), Data Type (Integer), and Format (Default).
 - A grid for defining granularities (Level-0 to Level-4) across attributes: sex, age, race, marital-status, education, native-country, workclass. The grid shows ranges like 0-4, 0-9, 0-19 for different levels.
 - Buttons for managing rows and columns: Insert row, Delete row, Insert column, Delete column, Move up, Move down, Edit item, Rename item, Clear, Initialize.
 - Privacy criteria: Type (5-Anonymity).
 - General settings: Max. suppression (1.0), Approximate (checkbox for Assume practical monotonicity), Precomputation (checkbox for Enable, Threshold 0.0).

At the bottom left, there is a "Research subset" section with fields for Size (5684), Total (30162), and Percentage (18,84). The selection mode is set to "Query + manual".

ARX: Configuration (2)

The screenshot shows the ARX Anonymization Tool interface. The main window title is "ARX Anonymization Tool - Example". The menu bar includes File, Edit, View, Help. The toolbar contains icons for opening files, saving, transforming, and analyzing. The status bar at the top right displays "Transformations: 12960 Selected: [0, 2, 0, 1, 2, 1, 1, 1, 0] Applied: [0, 2, 0, 1, 2, 1, 1, 1, 0]". Below the toolbar is a navigation bar with tabs: "Configure transformation" (selected), "Explore results", "Analyze utility", and "Analyze risk".

The main area is divided into several sections:

- Input data:** A table showing 26 rows of data with columns: sex, age, race, marital-status, education. All rows have "Female" checked under "sex". Rows 1 through 13 have "Female" checked; rows 14 through 26 have "Female" checked.
- Transformation Settings:** A panel on the right showing a list of attributes: sex, age, race, marital-status, education, native-country, workclass. The "Type" is set to "Quasi-Identifying", "Data Type" to "Integer", and "Format" to "Default". A grid table below shows ranges for each attribute across five levels (Level-0 to Level-4). The grid values are mostly "0-9" or "5-9" with some asterisks indicating specific rules.
- Privacy criteria:** A section showing "Type" as "Criterion" and "Attribute" as "(k) 5-Anonymity".
- Utility metric:** Set to "Loss".
- Monotonicity:** A checkbox for "Use monotonic variant" is checked.
- Aggregate Function:** Set to "Geometric Mean".

At the bottom left, there is a "Research subset" section with "Size: 5684 / 30162 = 18,84" and "% Selection mode: Query + manual".

ARX: Configuration (3)

The screenshot shows the ARX Anonymization Tool interface. The main window title is "ARX Anonymization Tool - Example". The menu bar includes File, Edit, View, Help. The toolbar contains icons for opening files, saving, transforming, and analyzing. The status bar at the top right displays "Transformations: 12960 Selected: [0, 2, 0, 1, 2, 1, 1, 1, 0] Applied: [0, 2, 0, 1, 2, 1, 1, 1, 0]". Below the toolbar is a navigation bar with tabs: "Configure transformation" (selected), "Explore results", "Analyze utility", and "Analyze risk".

The main area is divided into several sections:

- Input data:** A table showing a subset of the dataset. The columns are sex, age, race, marital-status, education, and workclass. Rows 1 through 26 are shown, all of which are female (checked). The "sex" column has a dropdown arrow icon.
- Transformation settings:** A panel on the right showing a grid for selecting levels of generalization for each attribute. The grid has columns for Level-0, Level-1, Level-2, Level-3, and Level-4. The "Type" is set to "Quasi-Identifying" and "Data Type" to "Integer".
- Privacy criteria:** A section showing "5-Anonymity" selected under the "Criterion" tab.
- Coding model:** A panel at the bottom with sliders for attributes: sex, age, race, marital-status, education, native-count, workclass, occupation, and salary-class. Each slider has a value of 0,500.

At the bottom left, the "Research subset" section shows "Size: 5684 / 30162 = 18,84 % Selection mode: Query + manual".

ARX: Configuration (4)

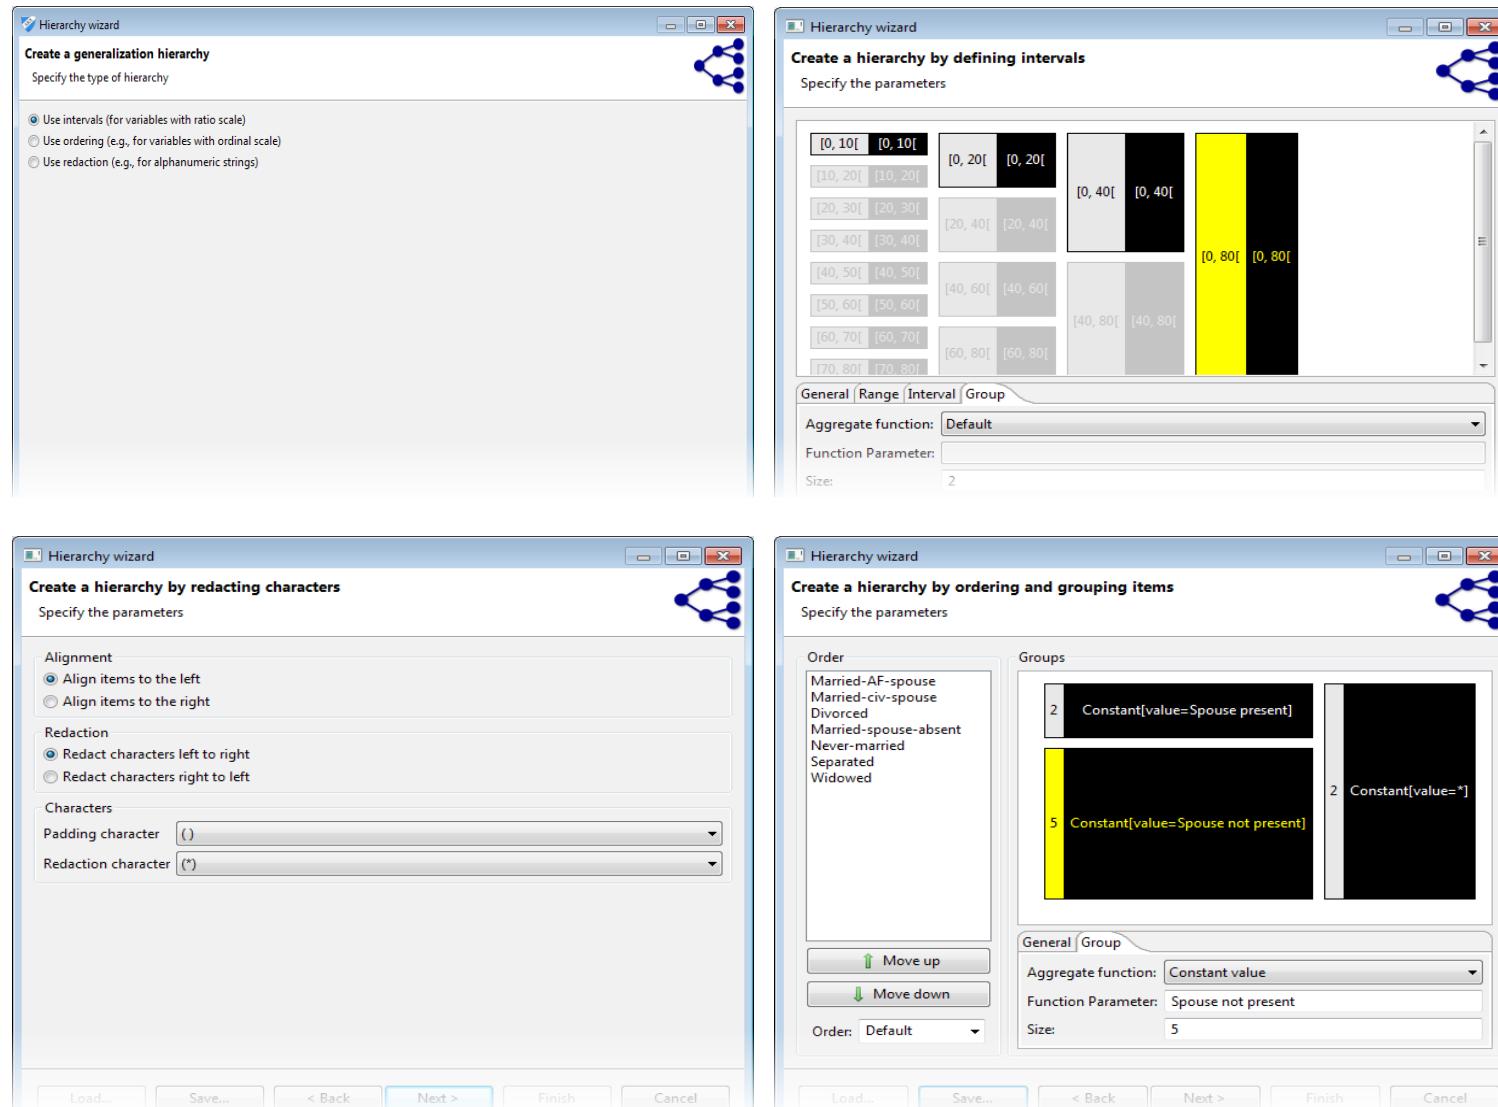

The screenshot shows the ARX Anonymization Tool interface. The main window title is "ARX Anonymization Tool - Example". The menu bar includes File, Edit, View, Help. The toolbar contains icons for opening files, saving, transforming, and analyzing. The status bar at the top right displays "Transformations: 12960 Selected: [0, 2, 0, 1, 2, 1, 1, 1, 0] Applied: [0, 2, 0, 1, 2, 1, 1, 1, 0]". Below the toolbar is a navigation bar with tabs: "Configure transformation" (selected), "Explore results", "Analyze utility", and "Analyze risk".

The main workspace is divided into several sections:

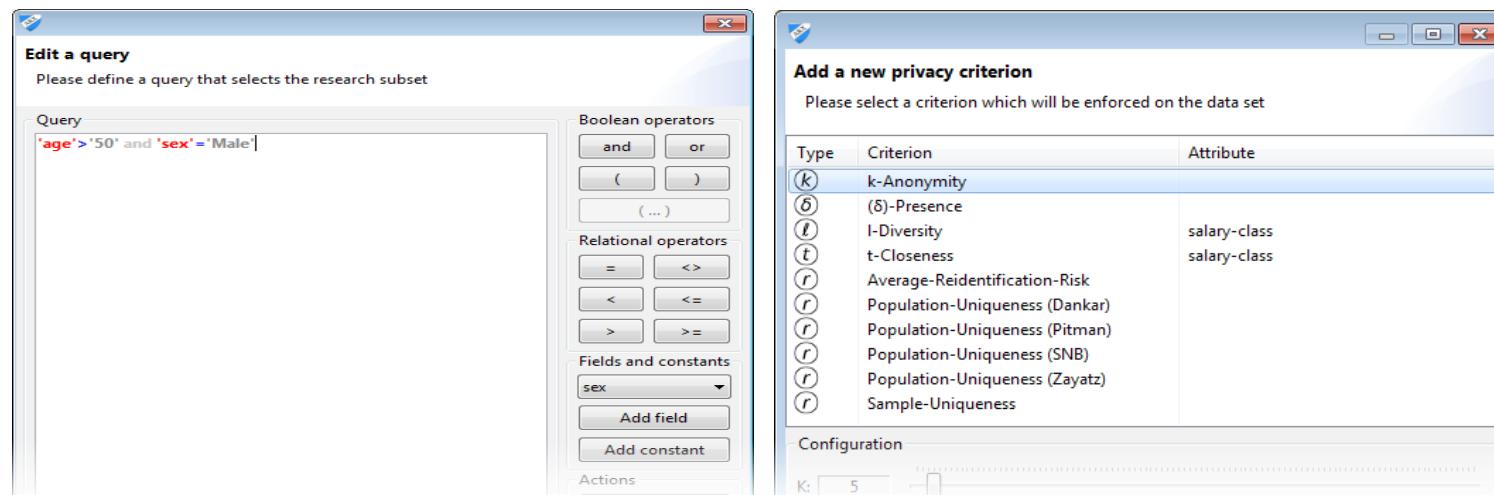

- Input data:** A table view showing 26 rows of data. The columns are labeled sex, age, race, marital-status, education, and workclass. All rows show "Female" in the sex column and "Female" checked in the transformation table.
- Transformation configuration:** A panel on the right where "sex" is selected as a Quasi-Identifying attribute of type Integer. It shows a grid for generalization levels Level-0 to Level-4, with values ranging from 0-4 to 0-19. The "Minimum" and "Maximum" dropdowns are set to "All".
- Privacy criteria:** A section showing "5-Anonymity" as the criterion.
- Population model:** A section showing the population model settings.
- General settings:** A tabbed panel with tabs for General settings, Utility metric, Attribute weights, and Coding model. The "Suppression" tab is selected.

At the bottom left, the "Research subset" section shows "Size: 5684 / 30162 = 18,84 % Selection mode: Query + manual". At the bottom right, there is a "Reset" button.

ARX: Wizard for transformation rules

ARX: Further dialogs

ARX: Exploration (1)

The screenshot shows the ARX Anonymization Tool interface. At the top, there is a menu bar with File, Edit, View, Help, and several icons. Below the menu is a toolbar with icons for configuration, exploration, analysis, and risk assessment. The status bar indicates Transformations: 12960, Selected: [0, 1, 0, 1, 2, 1, 1, 1, 0], and Applied: [0, 2, 0, 1, 2, 1, 1, 1, 0].

The main area displays a lattice diagram representing data transformations. Nodes are represented by ovals containing binary strings. The root node is yellow and labeled [0, 2, 0, 1, 2, 1, 1, 1, 0]. Several green nodes are shown below it, connected by lines. One specific node, [0, 1, 0, 1, 2, 1, 1, 1, 0], is highlighted with a callout box containing its properties:

- Information loss: 6,767 - 6,767 [%]
- * sex: 0,000 [%]
- * age: 25,000 [%]
- * race: 0,000 [%]
- * marital-status: 50,000 [%]
- * education: 66,667 [%]
- * native-country: 50,000 [%]
- * workclass: 50,000 [%]
- * occupation: 50,000 [%]
- * salary-class: 0,000 [%]

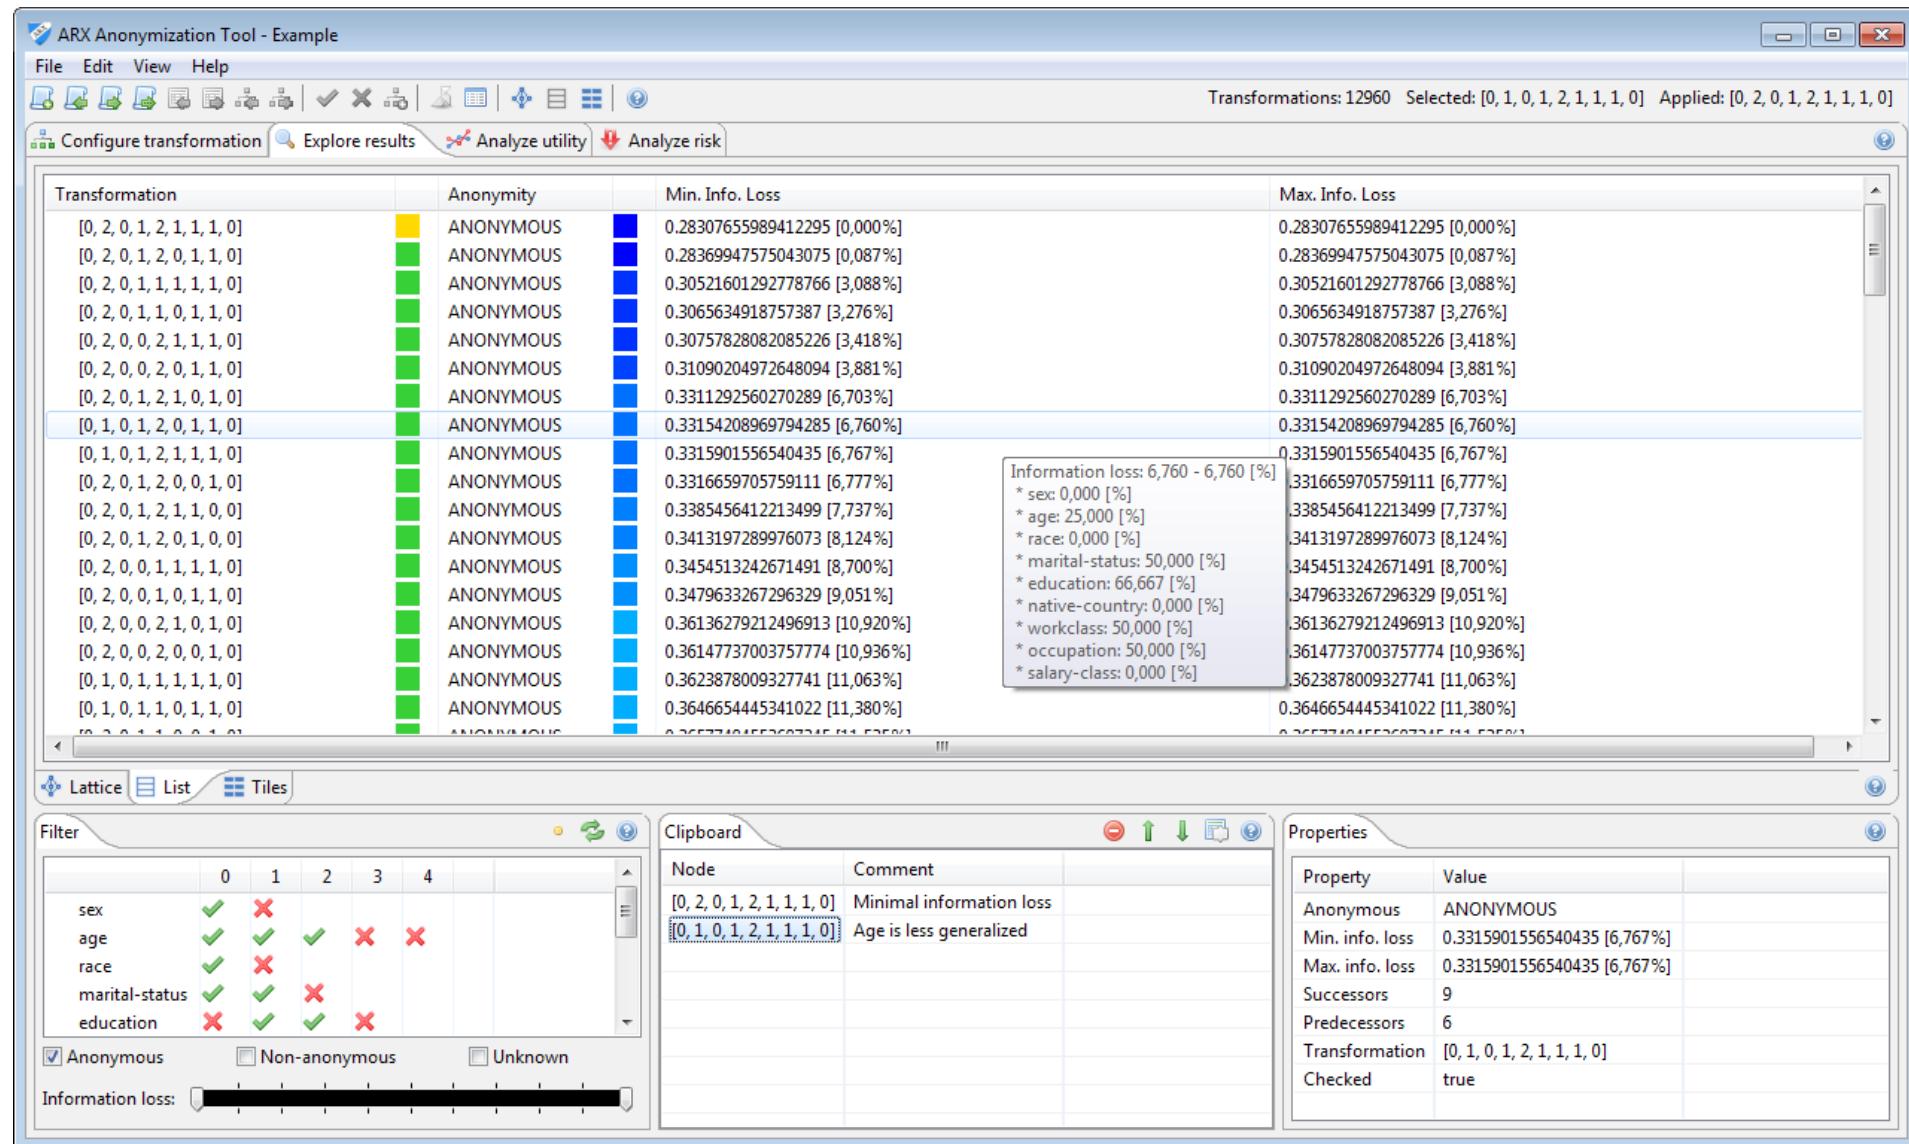

At the bottom of the interface, there are three tool panels: Filter, Clipboard, and Properties.

- Filter:** A grid showing the status of attributes (sex, age, race, marital-status, education) across five levels (0 to 4). Green checkmarks indicate successful transformations, while red X's indicate failures. A checkbox for "Anonymous" is checked, and a progress bar for "Information loss" is shown.
- Clipboard:** A table listing nodes and their comments:

Node	Comment
[0, 2, 0, 1, 2, 1, 1, 1, 0]	Minimal information loss
[0, 1, 0, 1, 2, 1, 1, 1, 0]	Age is less generalized
- Properties:** A table showing node properties:

Property	Value
Anonymous	ANONYMOUS
Min. info. loss	0.3315901556540435 [6,767%]
Max. info. loss	0.3315901556540435 [6,767%]
Successors	9
Predecessors	6
Transformation	[0, 1, 0, 1, 2, 1, 1, 1, 0]
Checked	true

ARX: Exploration (2)

The screenshot shows the ARX Anonymization Tool interface with the following components:

- Transformation Table:** A grid showing 20 transformations. Each row contains a transformation vector (e.g., [0, 2, 0, 1, 2, 1, 1, 0]), an anonymity level (ANONYMOUS), and minimum/maximum information loss values.
- Information Loss Detail:** A tooltip for the transformation [0, 1, 0, 1, 2, 1, 1, 0] provides detailed information loss data for various attributes: sex, age, race, marital-status, education, native-country, workclass, occupation, and salary-class.
- Lattice View:** Shows a grid of 0s and 1s representing the lattice structure of transformations based on attributes like sex, age, race, etc.
- Clipboard:** Displays comments for specific nodes, such as "Minimal information loss" and "Age is less generalized".
- Properties Panel:** Shows properties for the selected transformation node, including anonymous status, information loss values, and successor/predecessor counts.

ARX: Utility analysis (2)

The screenshot shows the ARX Anonymization Tool interface with two main panes: 'Input data' and 'Output data'. The 'Input data' pane displays a table of 15 rows with columns: age, race, marital-status, education, native-country, and work-class. The 'Output data' pane shows the same 15 rows after anonymization, with values like '50-59' for age and 'Black' for race. Below each pane is a distribution table. The left distribution table shows age values from 51 to 60 with their respective frequencies. The right distribution table shows age ranges (50-59, 60-69, 70-79, 80-89) and an asterisk (*) with their frequencies.

ARX: Utility analysis (5)

The screenshot shows the ARX Anonymization Tool interface with two main panes: Input data and Output data.

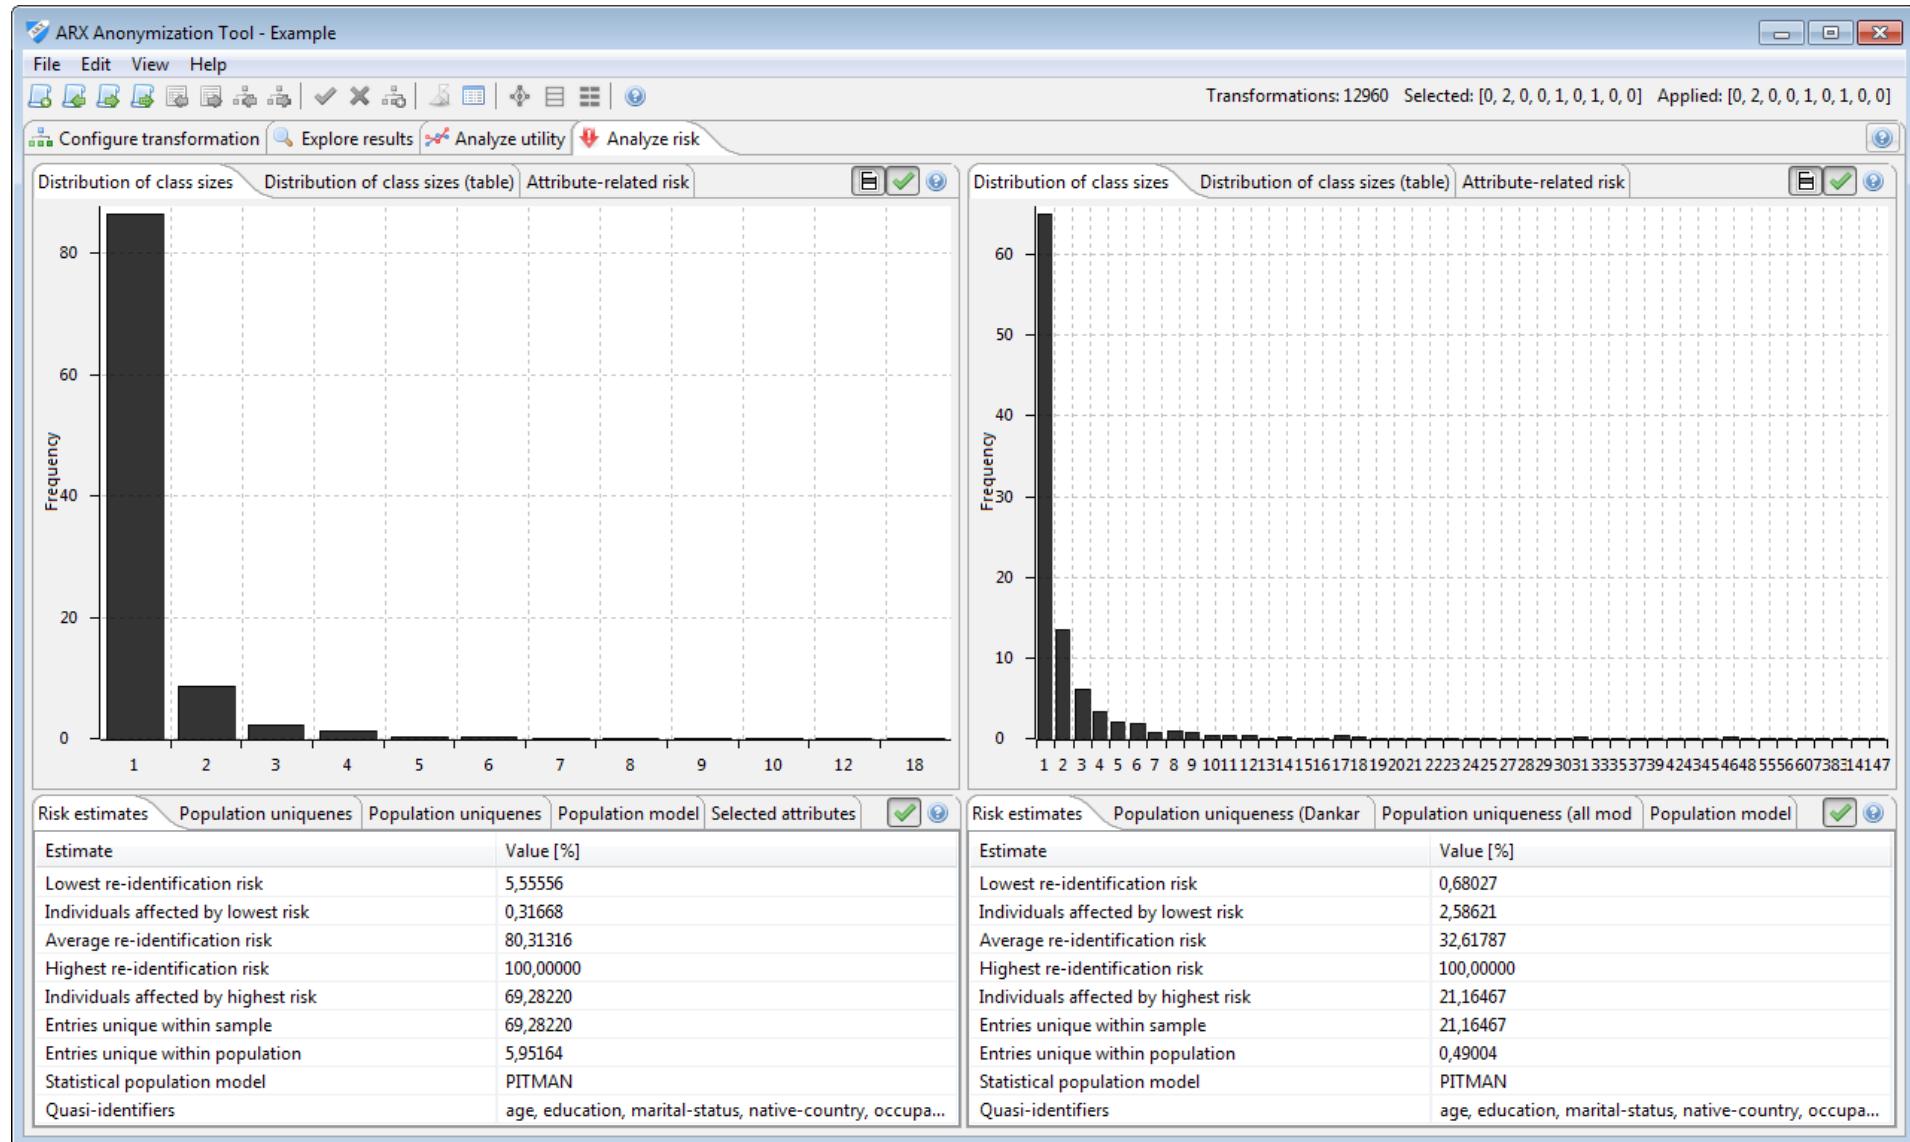

Input data: A table showing 15 tuples with attributes: age, race, marital-status, education, native-country, and work-class. The data includes various demographic information like age (51-56), race (Black, White), and education levels (Some-college, Bachelor's, Masters, Assoc-acdm, Assoc-voc).

Output data: A table showing the same 15 tuples after anonymization. The output includes attributes: age (50-59), race (Black, White), marital-status (spouse not present), education (Higher education), native-country (North America), and work-class (Non-Go, Govrn, Govrn). The 'work-class' column is partially cut off.

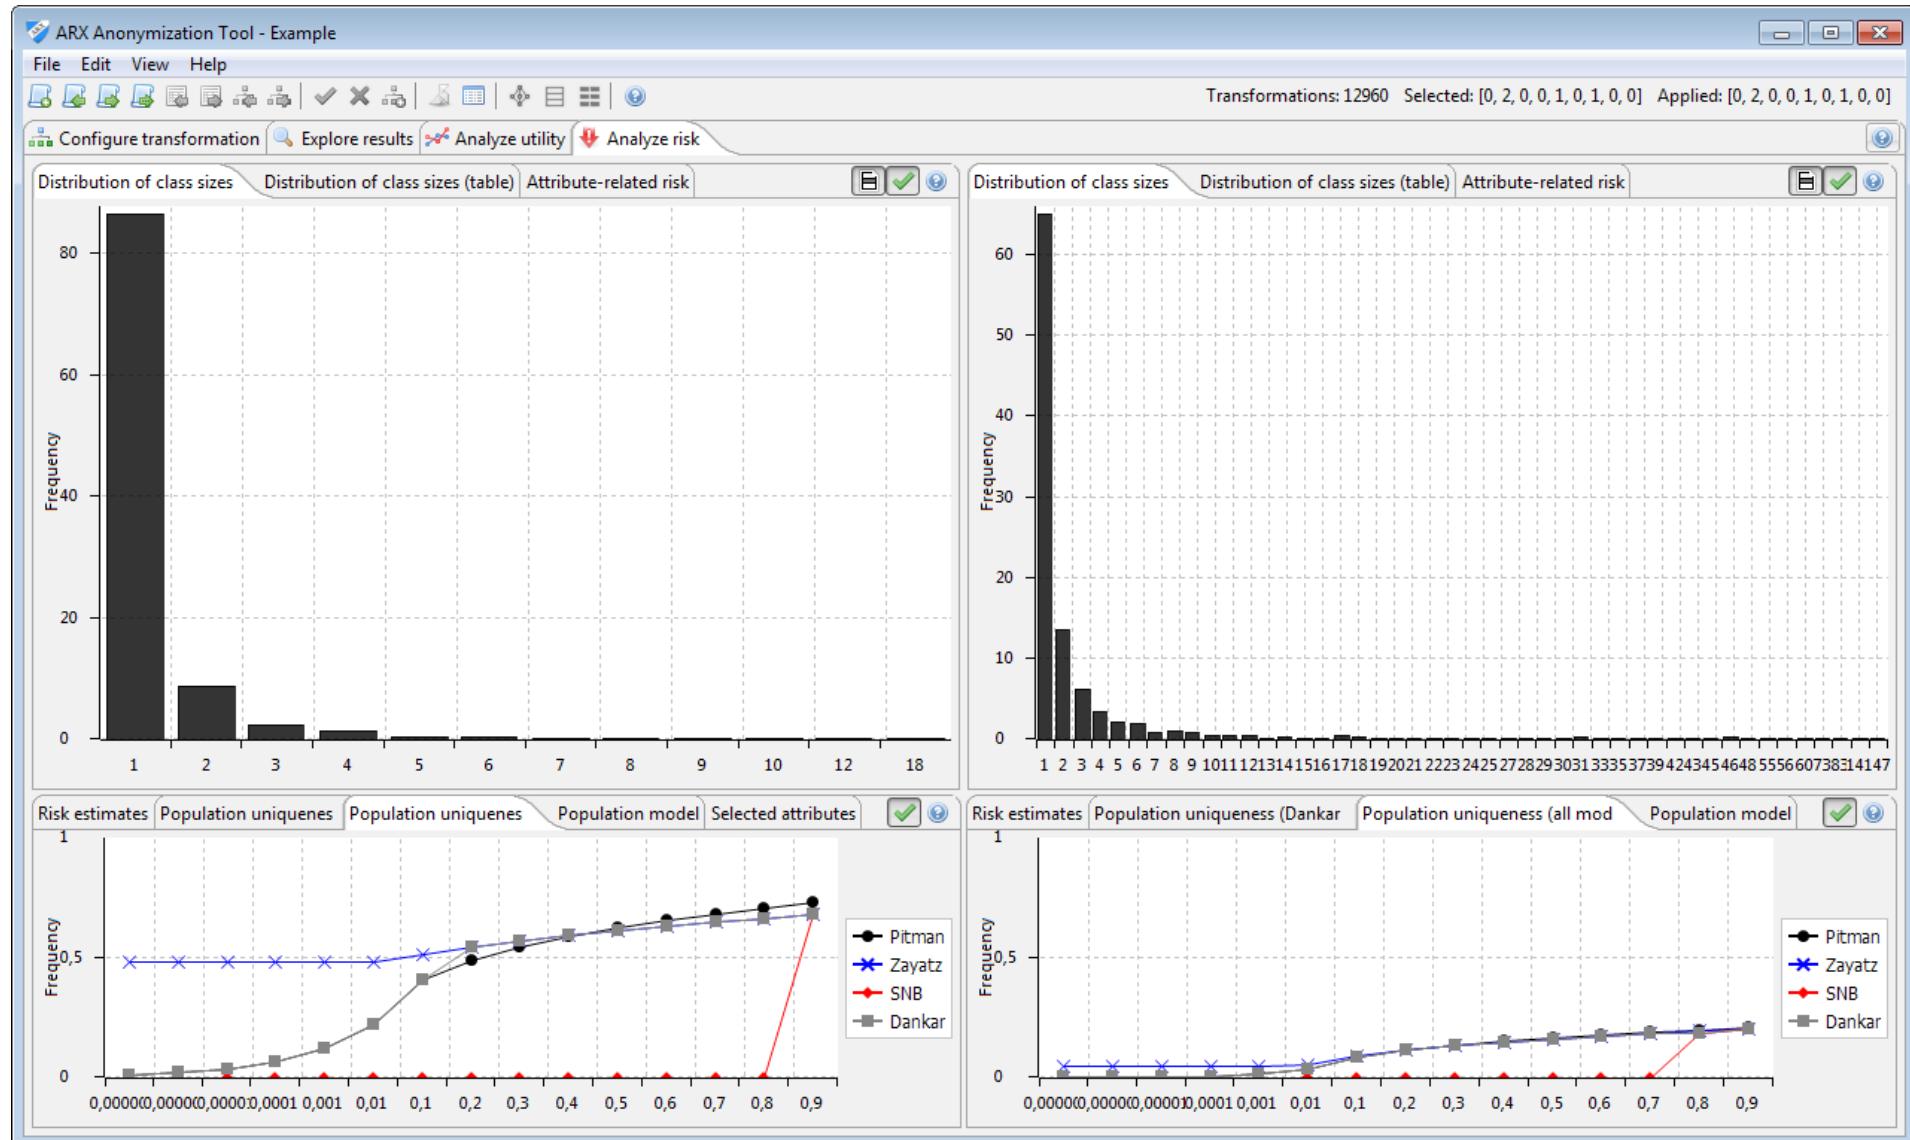

Distribution and Properties panes:

- Distribution:** Shows the count of tuples (30162) and the percentage of outliers (100.0 [%]).
- Properties:** Shows metrics like Loss (0.5/1.0/1.0), the number of attributes (9), and detailed information for each attribute (e.g., sex, age, race, marital-status, education) including their data type, format, height, and min/max values.
- Contingency and Contingency (Table):** These panes provide statistical information about the data, such as Outliers (741), Equivalence classes (654), Outlying classes (481), and class sizes (Min. class size: 5 (5), Max. class size: 311 (741), Avg. class size: 28.57225433526...).
- Transformation:** Shows the transformation applied, which is [0, 1, 0, 1, 2, 1, 1, 1, 0].
- Anonymity:** Shows the level of k-Anonymity achieved, which is 5.

- Applied:** [0, 2, 0, 0, 1, 0, 1, 0, 0]
- Quasi-identifier Risk Scores:**

Quasi-identifier	Score	Highest	Average
salary-class	0,233	96,683	9,555
workclass	0,255	98,730	8,165
sex	0,265	97,060	9,948
age	0,274	99,054	13,258
occupation	0,282	99,614	15,842
education	0,328	98,330	11,275
marital-status	0,360	99,066	14,740
race	0,368	99,625	19,527
native-country	0,492	100,000	11,166
occupation, salary-class	0,204	99,258	12,180
age, occupation	0,254	100,000	16,031
race, salary-class	0,257	99,414	15,112
sex, workclass	0,262	99,405	13,277
age, salary-class	0,269	98,893	15,959
salary-class, sex	0,273	98,805	15,292
age, workclass	0,281	100,000	15,289
age, education	0,283	99,414	13,209
occupation, sex	0,283	100,000	15,195
race, workclass	0,292	100,000	13,690

Bottom Panel (Configuration):

- Risk estimates:** Selected attributes: sex, age, race, marital-status, education, native-country, workclass, occupation.
- Population uniqueness:** Population uniqueness (Dankar) is selected.
- Region:** Germany is selected.
- Sampling fraction:** 0,0003734445998984734
- Population size:** 80767000

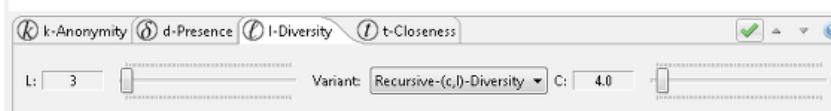

ARX: Context-sensitive help

The screenshot shows the ARX Help Center interface. On the left, a sidebar lists various help topics under "1. Perspectives". The topic "2.3. Defining privacy criteria" is currently selected, highlighted with a blue background. The main content area displays three tabs: "I-Diversity", "t-Closeness", and "d-Presence".

I-Diversity

Selecting this tab allows enforcing I-diversity for the currently selected sensitive attribute. To specify the details of the criterion, a slider can be used to define the diversity parameter l . A dropdown list allows selecting the type of I-diversity, i.e., distinct I-diversity, entropy I-diversity or recursive- (c,l) -diversity. If recursive (c,l) -diversity is selected, an additional slider can be used to select an appropriate value for the parameter c :

t-Closeness

Selecting this tab allows enforcing t-closeness for the currently selected sensitive attribute. Again, a dropdown list allows selecting the function that should be used for computing the closeness of data distributions. If "Hierarchical Earth Mover's Distance" is selected, a generalization hierarchy must be specified for the respective sensitive attribute. A slider enables selecting an appropriate value for the closeness parameter t :

d-Presence

Analogously to k-anonymity, d-presence is enforced for all quasi-identifiers. Two sliders can be used for selecting appropriate values for the d_{\min} and d_{\max} parameters:

OK

ARX: Further developments

- **Current projects**

- Non-interactive Differential Privacy
- Support for high-dimensional data: heuristic algorithms
- Further analyses and visualizations: utility and risks
- Support for transactional attributes: (k, k^m) -anonymity
- Integrated data masking methods
- More flexible definition of quasi-identifiers
- More risk models

- **Planned projects**

- Auto-detection of HIPAA identifiers
- Implement more flexible privacy criteria

Thank you for your attention
