

Liquid-biobanking in:

- 1.) Epidemiological studies (prevalence, incidence)**
- 2.) disease-oriented biobanks (case-control studies, cohort studies)**
- 3.) biobanks for clinical studies**
- 4.) biobanks in laboratory medicine**

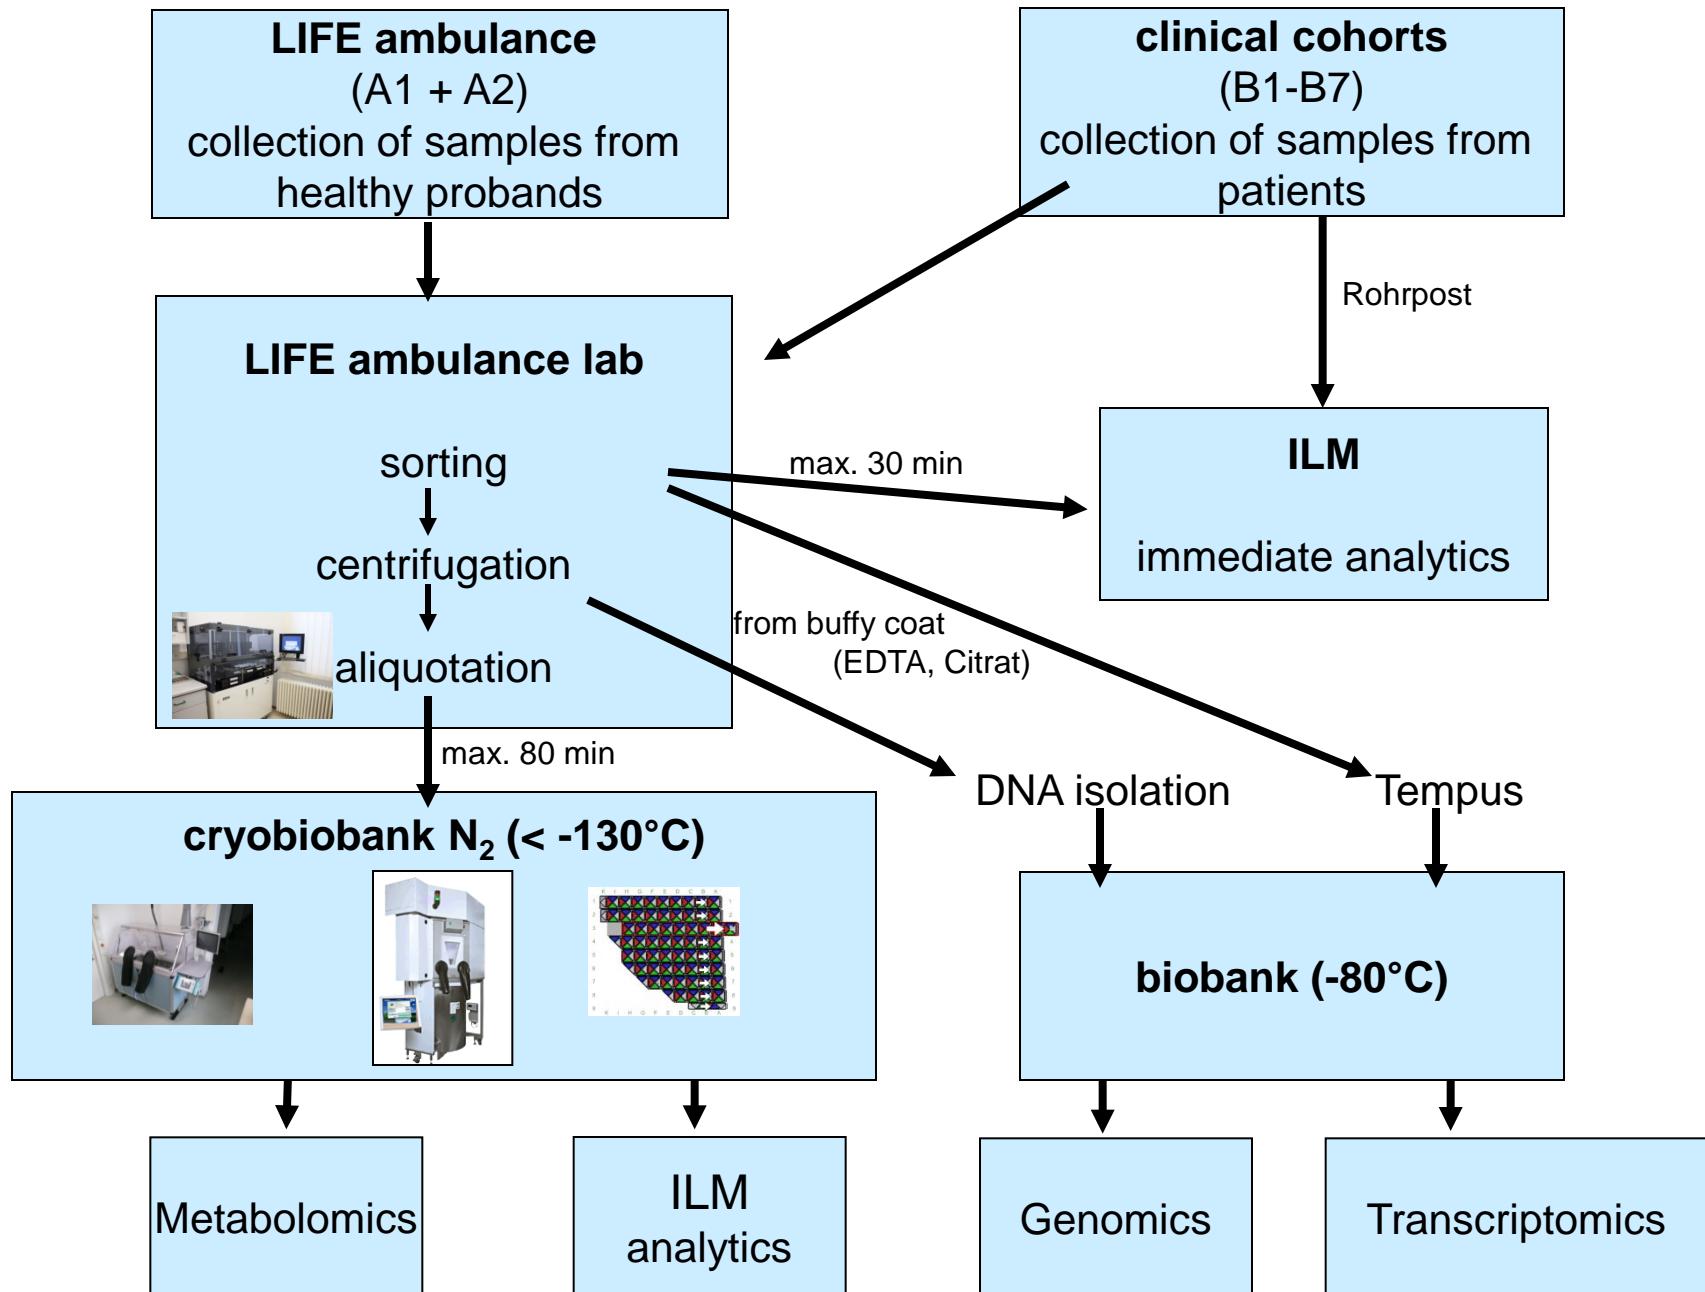

**High sample quality
and standardisation of samples
is important for the
development of new innovative
diagnostics!**

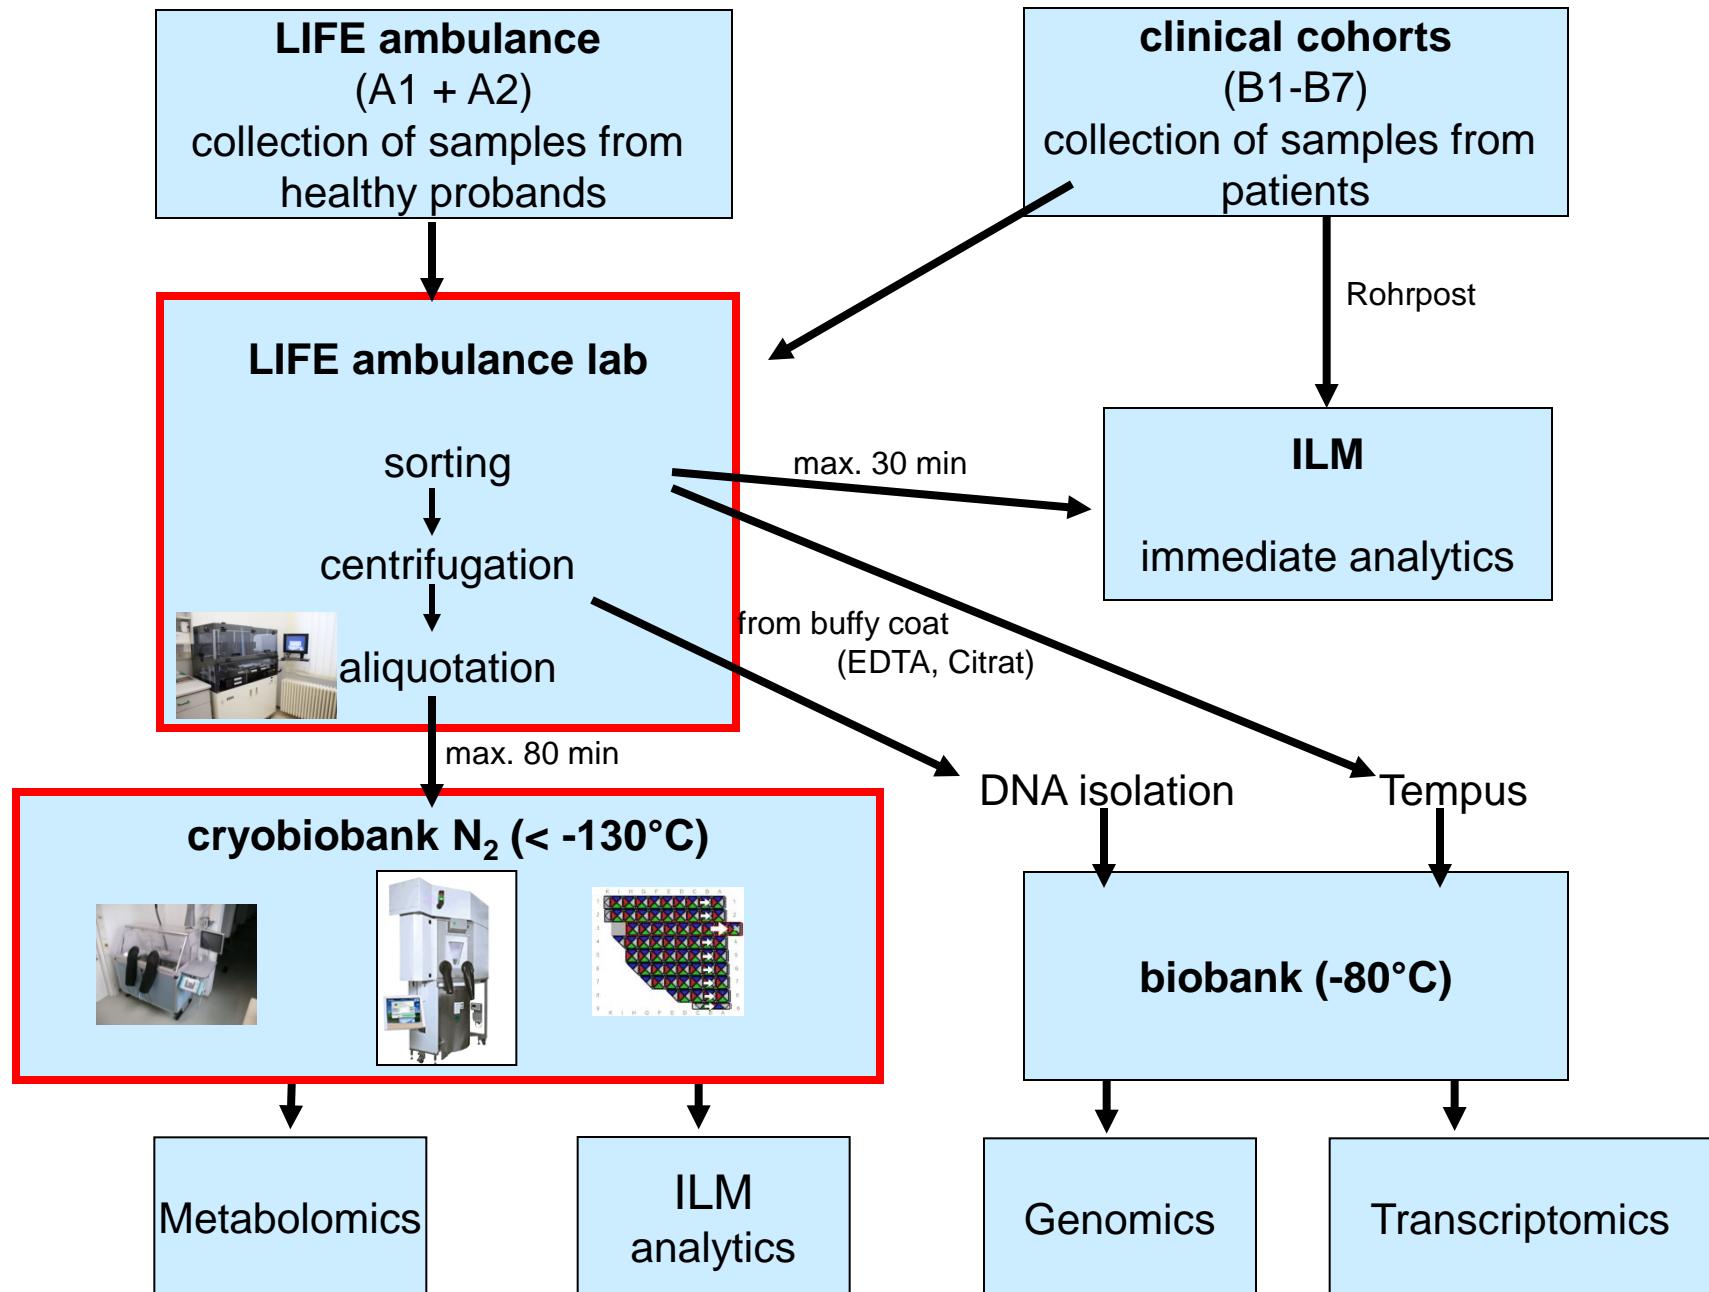

Factors influencing biomarker quality

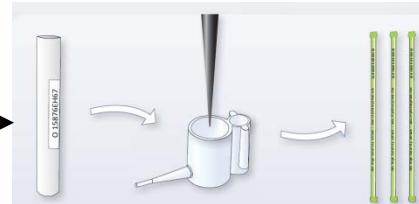

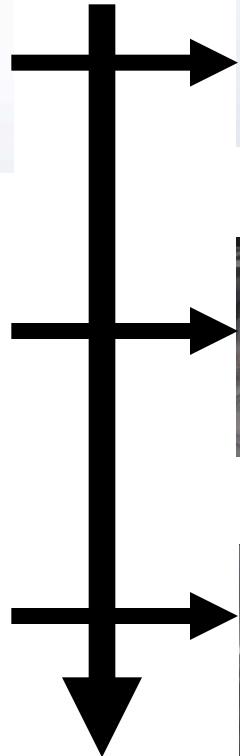

Phase	Factors	activities
Blood collection	Sample material Volume (esp. citrate)	SOPs
Sample transport	Temperature Duration Delivery System	SOPs
Sample preparation	Centrifugation speed Duration Temperature	SOPs, Automatisation
Storage	Temperature Duration Freeze-Thaw-Cycles	SOPs, Automatisation, sample handling at low temperatures, high number of aliquots

First biobanking output

- exom analysis of 780 children for association with different phenotypes in cooperation with WTCCC
- genome wide association study for the regulation of plasma plant sterol concentrations
- genome wide association study and eQTL analysis of 3.000 participants of the cardiovascular disease cohort for determination of risk factors of coronary artery disease
- genome wide association study of the adult cohort addressing multiple phenotypes (starting end of december)
- ...

Future plans

Complete automation of the LIFE cryobiobank
